1. Introduction

This report presents results from the CY2020 impact evaluation of ComEd's Voltage Optimization (VO) Program. It summarizes the total energy and demand impacts for the program broken out by relevant measure and program structure details. Based on guidance from the Illinois Stakeholder Advisory Group (SAG), Guidehouse normalized CY2020 program savings for the coronavirus pandemic.¹ The appendices provide the impact analysis methodology and details of the total resource cost (TRC) inputs. CY2020 covers January 1, 2020 through December 31, 2020.

2. Program Description

The VO Program includes ComEd's plan to install hardware and software systems on a significant fraction of its electric power distribution grid to achieve voltage and reactive power optimization (volt-var optimization, or VVO) over the 2018-2025 timeframe. VVO is a smart grid technology that uses distributed sensors, two-way communications infrastructure, remote controls on substation transformer load-tap changers and line capacitor banks, and integrating/optimizing software to flatten voltage profiles and lower average voltage levels on an electric power distribution grid. ComEd is working with an automation-optimization hardware and software vendor² to implement the VO Program on selected parts of its distribution grid over the 2018-2025 period.

Unlike energy efficiency programs that achieve savings by providing financial incentives to encourage customers to adopt energy-efficient equipment or behavioral suggestions to encourage them to adopt no-cost energy-saving behaviors, the VO Program involves no direct customer engagement. Instead, savings is achieved by operating the voltage and reactive power controls on VO-enabled feeders and substations in a manner designed to maintain the voltages delivered to affected customers in the lower part of the allowable voltage range.³

The program installed and commissioned VO systems on 428 feeders at 43 substations in CY2020;⁴ 40 substations were newly activated with VO in CY2020 and three were previously activated but had VO added to additional transformers in CY2020. Table 2-1 shows this information.

¹ This decision is documented in meeting notes from the June 11 and August 24, 2020 SAG meetings (available at <https://www.ilsag.info/events/list>).

² Open Systems International (OSI) of Medina, Minnesota.

³ The bulk of the energy savings that occurs is thus expected to occur on the customer side of the meter, although additional savings is expected from reduced current flows along the full length of the affected circuits.

⁴ CY2020 VO installations occurred throughout the program year. Table 2-1 shows only those substations and feeders on which installation, commissioning, and system testing were completed by December 31, 2020. This table excludes feeders wherein VO was fully enabled on a transformer in CY2020, but the specific feeder did not have any load in CY2020 and feeders where VO was initially enabled but not fully functional in CY2020. It is expected that savings for these types of feeders will be claimed in a future year (either when load is added to the feeder or when VO is fully functional).

Table 2-1. CY2020 Volumetric Findings Detail

Participation	Total
Newly VO-Enabled Substations	40
Previously VO-Enabled Substations with new VO Transformers	3
VO-Enabled Feeders	428

Source: ComEd tracking data and evaluation team analysis

3. Program Savings Detail

Table 3-1 summarizes the incremental energy and demand savings the VO Program achieved in CY2020. As VO is not a customer-facing program, there is no free ridership and no spillover, and as such the net-to-gross (NTG) ratio is 1 and net and verified gross savings are identical. The program did not claim, and the evaluation did not examine, gas savings.

Table 3-1. CY2020 Total Annual Incremental Electric Savings

Savings Category	Energy Savings (kWh)	Summer Peak* Demand Savings (kW)
Electricity		
Ex Ante Gross Savings	216,582,437	46,424
Program Gross Realization Rate	1.00	0.97
Verified Gross Savings	215,996,316	45,134
Program Net-to-Gross Ratio (NTG)	1.00	1.00
Verified Net Savings	215,996,316	45,134
Converted from Gas†		
Ex Ante Gross Savings	NA	NA
Program Gross Realization Rate	NA	NA
Verified Gross Savings	NA	NA
Program Net-to-Gross Ratio (NTG)	NA	NA
Verified Net Savings	NA	NA
Total Electric Plus Gas		
Ex Ante Gross Savings	216,582,437	46,424
Program Gross Realization Rate	1.00	0.97
Verified Gross Savings	215,996,316	45,134
Program Net-to-Gross Ratio (NTG)	1.00	1.00
Verified Net Savings	215,996,316	45,134

NR = not reported (refers a piece of data that was not reported, i.e., non-coincident demand savings).

NA = not applicable (refers a piece of data cannot be produced or does not apply).

* The coincident summer peak period is defined as 1:00 p.m.-5:00 p.m. Central Prevailing Time on non-holiday weekdays, June through August.

† The evaluation did not estimate gas savings for this program.

Source: ComEd tracking data and evaluation team analysis

4. Cumulative Persisting Annual Savings

Table 4-1 show the measure-specific and total verified gross savings for the VO Program and the cumulative persisting annual savings (CPAS) for the measures installed in CY2020. Figure

4-1 shows the savings across the useful life of the program. The electric CPAS across all measures installed in 2020 is 215,966,316 kWh (Table 4-1). Guidehouse did not evaluate gas savings for this program and as such electric CPAS is equivalent to total CPAS. The historic rows in each table are the CPAS contribution back to CY2018. The Program Total Electric CPAS row is the sum of the CY2020 contribution and the historic contribution.

Table 4-1. Cumulative Persisting Annual Savings (CPAS) – Electric

End Use Type	Research Category	CY2020			Verified Net kWh Savings

* Expiring savings are equal to CPAS Y_{n-1} - CPAS Y_n + Expiring Savings Y_{n-1} .

Source: *Evaluation team analysis*

5. Program Savings by Measure

There is only one measure in the VO Program and so measure-level results are the same as the program-level results discussed in the previous section. See Appendix B for detailed savings results.

6. Impact Analysis Findings and Recommendations

6.1 Impact Parameter Estimates

The VO Program does not have relevant impact parameters.

6.2 Other Impact Findings and Recommendations

The evaluation team developed several recommendations based on findings from the CY2020 evaluation.

Finding 1. Guidehouse and ComEd identified six feeders that had VO enabled in CY2020 but did not have any load on them in CY2020.⁵ These feeders are removed from the CY2020 evaluation.

Recommendation 1. After discussion with ComEd and Illinois Commerce Commission (ICC) staff, Guidehouse recommends these feeders be included in a future annual evaluation if they

⁵ Note that VO is enabled at the transformer level and many transformers contain multiple feeders.

meet certain criteria.⁶ ComEd is working on a memo that will explain the criteria to determine when these feeders are ready to be claimed.

Finding 2. Similar to CY2019, ComEd identified a small number of feeders where VO was enabled in CY2020 but was not fully functional throughout the rest of the year.

Recommendation 2. As in CY2019, Guidehouse recommends that these feeders be claimed in the year when VO is fully operational.⁷

Finding 3. Based on guidance from SAG, Guidehouse normalized CY2020 savings for pandemic-related impacts. Based on the method ComEd, Guidehouse, and ICC staff agreed to (a visual comparison of 2020 data versus 2019 during the same time period), Guidehouse and ComEd agreed that usage data (power or current) was affected by the pandemic during Phases 1 and 2 of the Illinois coronavirus response for approximately one-quarter of feeders while voltage data was not affected. Phase 1 began on March 16 and Phase 2 ended on May 28; together these phases covered the most extreme periods of pandemic restrictions in Illinois.⁸

Recommendation 3. Guidehouse recommends that usage data be removed during Phases 1 and 2 of the Illinois coronavirus response for the affected feeders. This was implemented in this report and Appendix A describes this in further detail.

⁶ Accordingly, these feeders were excluded from the CY2020 feeder count in Table 2-1.

⁷ Accordingly, these feeders were excluded from the CY2020 feeder count in Table 2-1.

⁸ More information on restrictions by phase can be found at <https://coronavirus.illinois.gov/s/restore-illinois-introduction>.

Appendix A. Impact Analysis Methodology

The evaluation team used the approach specified in the Illinois Statewide Technical Reference Manual (TRM v9.0) to estimate the VO Program's energy and demand savings.⁹

A.1 Energy Savings Methodology

The TRM relies on a conservation voltage reduction factor (CVRf), which is deemed at 0.8, and utilizes Equation A-1 to estimate energy savings.

Equation A-1. Energy Savings Calculation

$$\text{Energy Savings} = \text{Energy Baseline} * \text{CVRf} * \text{Voltage Reduction Percentage}$$

In accordance with the TRM, in cases where power (MW) data was not available, Guidehouse converted the corresponding current (amps) value to MW using Equation A-2 through Equation A-4. This conversion was applied to at least some of the data used for reconstruction (data from January 1, 2019 to January 31, 2021) for 181 feeders.

Equation A-2. Amps-to-MW Conversion (Three-Phase with Line-to-Line Voltage)

$$P_t = \sqrt{3} * V_t * I_t * p_f$$

Equation A-3. Amps-to-MW Conversion (Three-Phase with Line-to-Neutral Voltage)

$$P_t = 3 * V_t * I_t * p_f$$

Equation A-4. Amps-to-MW Conversion (Single Phase)

$$P_t = V_t * I_t * p_f$$

Where:

- | | |
|-------|--|
| P_t | Calculated MW data at time t |
| V_t | Average measured voltage at time t |
| I_t | Average measured amps at time t |
| p_f | Power factor assumed to be 0.9 ¹⁰ |

In accordance with the TRM that the evaluator will address any data quality issues, Guidehouse cleaned the megawatt (MW) and voltage data by removing anomalous values of the following types:

1. Negative values¹¹

⁹ See Measure 6.2.1, Volume 4, Version 9.0 of the TRM (TRM v9.0). Note that we are referencing TRM v9.0 even though TRM v8.0 is applicable in CY2020 because this measure was new for TRM v9.0 and so not included in TRM v8.0.

¹⁰ Guidehouse used ComEd's assumed power factor of 0.9. We reviewed this parameter during our CY2019 evaluation and found this assumption to be reasonable.

¹¹ Only negative voltage values are removed in this step. Note negative usage values are removed as outliers in step 7 for feeders without distributed energy resources (DER).

2. Non-numeric values
3. Zero values
4. Missing values
5. Repetitive values¹²
6. Interpolated values¹³
7. Outlier values
 - a. MW
 - i. Defined as values above 110% or below 10% of the feeder peak load for feeders without distributed energy resources (DER).
 - ii. Defined as values above 110% of the feeder peak load or below the expected reverse power for feeders with DER.¹⁴
 - b. Voltage
 - i. Defined as values above 1.10 per unit (p.u.) and below 0.90 p.u. of the nominal line-to-line voltage level for regular transformers and the line-to-neutral voltage for DC-in-a-box (DCIAB) transformers.

Guidehouse also executed the following data cleaning steps specific to CY2020 data anomalies:

- Power (MW) or current (amps) data were excluded from March 16 through May 28¹⁵ for 119 feeders that appeared to be affected by pandemic-related impacts based on the method ComEd, Guidehouse, and ICC staff agreed to (a visual comparison of 2020 load data versus 2019 during the same time period). This was done in accordance with the SAG decision that CY2020 savings should be normalized for the effects of the pandemic.
- For 13 transformers across five substations (covering 48 feeders) commissioning the transformer for VO revealed that the voltage was lower than the standardized operating level within ComEd territory. As a result, ComEd made a discrete increase to the voltage before enabling VO to bring it up to an acceptable level. For these transformers, voltage data from January 1, 2019 until said shift were excluded from the analysis.
- For 28 transformers across eight substations (covering 149 feeders), enabling VO revealed that new equipment was needed for the full potential reduction in voltage from VO to be realized. Installations were completed between September and November of 2020 and resulted in a revised VO go live date to acknowledge that only the savings after VO was operating at its full potential reflect the expectation of how VO will operate for the rest of the 15 year measure life. For the analysis load and voltage data for VO on

¹² Repetitive values are cases where three values in a row match up to six decimal places.

¹³ Interpolated values are detected when the difference between values is the same (up to three decimal places) for at least two values in a row.

¹⁴ The expected reverse power flow (P_{rev}) is calculated based on the total installed DER capacity on the feeder (P_{DER}) and the expected feeder demand during DER peak time ($P_{Demand} = 50\%$ of feeder peak load):

$$P_{rev} = P_{Demand} - P_{DER}$$

¹⁵ These dates align with the start of Phase 1 of the coronavirus response in Illinois and the end of Phase 2, covering the most extreme restrictions. More information on restrictions by phase can be found at <https://coronavirus.illinois.gov/s/restore-illinois-introduction>.

periods before the revised VO go live date were excluded and the VO status was assumed to be off.

- Four feeders being claimed in CY2020 were initially enabled in CY2019 but were not fully functional and thus could not be claimed in CY2019. For three of these feeders (C211, C858, and G091), any VO on periods in 2019 were assumed to be off and the associated load and voltage data were excluded. For the fourth feeder (W513), all VO on periods through June 17, 2020 were assumed to be off without the removal of any load or voltage data; separately for this feeder, certain instances of voltage data were excluded for being more volatile than usual (similar to the next bullet).
- One feeder (H651) had periods of more volatile than usual voltage due to equipment issues. Voltage for these periods was excluded from the analysis.

In accordance with the TRM v9.0, Guidehouse created a lookup table to reconstruct load (MW¹⁶) and voltage data that was missing or eliminated by the data cleaning process based on the priority sequence shown in Table A-1. Guidehouse used data from January 1, 2019 through January 31, 2021 to reconstruct data for CY2020. Compared to CY2019, bins 14 to 26 were added to reflect rare instances where a specific feeder has no available data for one VO status or the other.¹⁷

¹⁶ Either recorded MW or MW converted from amps.

¹⁷ This is only expected to occur very rarely if a feeder had VO go live toward the very end of the year paired with a stretch of missing data or data removed during cleaning. This occurred for one feeder's, G6092, load (MW) data in CY2020.

Table A-1. Data Reconstruction Priority Sequence

Priority	Components and Commonalities of Table
1	Season*, Temperature†, Day Type‡, Hour§, VO Status
2	Temperature, Day Type, Hour, VO Status
3-5	Temperature +/-5 , Day Type, Hour, VO Status
6	Season, Day Type, Hour, VO Status

20	Temperature, Day Type
21	Season, Day Type
22	Temperature
23	Season
24	Day Type, Hour
25	Day Type
26	- #

* Seasons are: Spring (March to May), Summer (June to August), Fall (September to November), and Winter (December to February)

† Temperature was binned to the ceiling of the nearest 5°F interval.
 Guidehouse sourced temperature data from the National Oceanic and Atmospheric Administration (NOAA) Quality Controlled Local Climatological Data (QCLCD) weather station geographically closest to each feeder.
 Guidehouse filled in missing data via linear interpolation (for gaps of four or fewer hours) or from the next closest weather station (for gaps longer than four hours).

‡ Day types are weekdays (Monday to Friday) and weekends (Saturday and Sunday).

§ Hour refers to the same hour of the day.

|| Temperature +/-5 refers to temperatures one 5°F bin above or below the temperature of the observation being reconstructed. This occurred in three stages where we first looked across the bin above and below and then in just one or the other if there were no data points in one of them.

All data points will be averaged.

Source: ComEd and Guidehouse

Load and voltage data were cleaned separately and Table A-2 shows how much of the reconstructed data for each unit came from each priority bin in Table A-1.

Table A-2. Data Reconstruction

Priority Bin	Percentage Voltage Data (kV)	Percentage Load Data (MW)
Actual Measured	83.67%	81.89%
1	12.75%	17.45%
2	3.15%	0.49%
3-5	0.29%	0.14%
6	0.00%	0.00%
7	0.04%	0.01%
8	<0.01%	0.00%
9	0.01%	0.00%
10	0.00%	0.00%
11	0.09%	0.00%
12	0.00%	0.00%
13	0.00%	0.00%
14	0.00%	0.02%

Note priority bins below 14 were never utilized in the CY2020 evaluation.

Source: *ComEd tracking data and evaluation team analysis*

To estimate the voltage reduction percentage, Guidehouse constructed the counterfactual voltage profile based on the same priority sequence as Table A-1 shows.¹⁸

In estimating energy savings, Guidehouse accounted for line losses of 3.67%¹⁹ and a de-rating factor of 0.3003% to account for times when VO is expected to be off for reasons that are within ComEd's control for each year of the 15 year measure life. The calculation of the de-rating factor is discussed in Section Appendix D.

A.2 Peak Demand Savings Methodology

The estimation of peak demand savings was similar to energy savings and follows Equation A-5.

Equation A-5. Peak Savings Calculation

$$\text{Peak Savings} = \text{Peak Baseline} * \text{CVR}_{peak} * \text{Voltage Reduction Percentage}_{peak}$$

Where:

Peak Baseline

Baseline kW usage on the feeder during the peak period, defined as 1:00 p.m.-5:00 p.m. CDT on non-holiday weekdays from June 1 to August 31. This

¹⁸ For constructing the counterfactual voltage profile only bins 1-13 are used.

¹⁹ Distribution system energy losses are assumed to be 3.67%, based on ComEd's filed 2019 ComEd Distribution System Loss Study.

ComEd. 2020. 2019 ComEd Distribution System Loss Study. Docket No. 20. ComEd Ex. 6.01. Available at: <https://www.icc.illinois.gov/downloads/public/edocket/520735.PDF>

was be calculated in the same manner as baseline for energy savings but with the intent of estimating the baseline just for the peak period as opposed to for the entire year.

$CVRf_{peak}$

$Voltage\ Reduction\ Percentage_{peak}$

1.02

Percentage voltage reduction on the feeder caused by VO during the peak period, defined as 1:00 p.m.-5:00 p.m. CDT on non-holiday weekdays from June 1 to August 31. This was be calculated in the same manner as for energy savings but with the intent of estimating the peak period as opposed to the entire year.

Appendix B. Impact Analysis Detail

Table B-1 presents the verified CY2020 VO Program energy impacts and realization rate by feeder, Table B-2 presents the same for demand, and Table B-3 rolls results up to the substation.

Appendix C. Total Resource Cost Detail

Table C-1 shows the TRC cost-effectiveness analysis inputs available at the time of finalizing this impact evaluation report. Additional required cost data (e.g., measure costs, program-level incentive, and non-incentive costs) are not included in this table and will be provided to the evaluation team later.

Table C-1. Total Resource Cost Savings Summary

End Use Type	Research Category	Units	Quantity	EUL (years)*	ER Flag†	Gross	Gross	Gross	Gross			Net Electric Energy Savings (kWh)	Net Peak Demand (kW)	Net Gas Savings (Therms)	Net Secondary Savings due to Water Reduction (kWh)	Net Heating Penalty (kWh)	Net Heating Penalty (Therms)			
						Electric Energy Savings (kWh)	Peak Demand (kW)	Gas Savings (Therms)	Savings due to Water Reduction (kWh)	Gross Heating Penalty (kWh)	Gross Heating Penalty (Therms)	NTG (kW)	NTG (Therms)	NTG (kW)						
All	VO	Feeders	428	15.0	No	215,996,316	45,134	NA	NA	NA	NA	1.00	1.00	1.00	215,996,316	45,134	NA	NA	NA	NA
	Total			NA		215,996,316	45,134	0	0	0	0	NA	NA	NA	215,996,316	45,134	0	0	0	0

* The total of the EUL column is the weighted average measure life (WAML) and is calculated as the sum product of the EUL and measure savings divided by total program savings.

† Early Replacement (ER) measures are flagged as YES, otherwise a NO is indicated in the column.

Appendix D. De-Rating Factor Calculation

To calculate a de-rating factor to account for times when VO is expected to be off for reasons that are within ComEd's control for each year of the 15 year measure life, ComEd reviewed the intended on-off VO cycling schedule versus the actual VO status logs and identified misalignments greater than a day (48 half hourly intervals). ComEd categorized each of these deviations as excludable or not-excludable based on the TRM.

ComEd identified misalignments between the schedule and the logs 7.18% of the time; this breaks down into 6.88% excludable and 0.30% not-excludable. Table D-1 shows this breakdown. Guidehouse applied the not-excludable percentage (0.3003%) as a de-rating factor to the annualized savings.

Table D-1. Excludable and Not-Excludable Percentage of TRM Defined Categories

Event	Category	Duration (half hourly intervals)	Percentage (%)
VO Control System	Excludable	30,362	1.78%
	Not-Excludable	0	0.00%
Loss of communication	Excludable	4,008	0.24%
	Not-Excludable	556	0.03%
System Operational Requirements	Excludable	82,789	4.86%
	Not-Excludable	0	0.00%
Equipment Issue	Excludable	0	0.00%
	Not-Excludable	4,560	0.27%
VO On-Off Cycling Schedule	Excludable	0	0.00%
Under Investigation	Not-Excludable	0	0.00%
Customer Maintenance	Excludable	0	0.00%
Summary	Not-Excludable	5,116	0.3003%
	Excludable	117,159	6.8763%
