# **1. INTRODUCTION**

This report presents the results of the impact evaluation of the Joint Utility CY2018 Public Housing Energy Savings (PHES) Program implemented for ComEd, Nicor Gas, Peoples Gas and North Shore Gas companies. It presents a description of the program, a summary of 2018 participation, a summary of the energy and demand impacts for the total program; and more detailed impact information by relevant measure. The appendix presents the impact analysis methodology. CY2018 covers January 1, 2018 through December 31, 2018.

## **2. PROGRAM DESCRIPTION**

The PHES Program works with Public Housing Authorities (PHAs) in ComEd and gas utility service territories to achieve electric and gas savings. The PHA itself is the program participant, though the residents of the properties are directly impacted by the program through in-unit and common area upgrades. In 2018, the program provided direct installation measures to residential units, including LEDs, advanced power strips, and gas-saving measures such as faucet aerators and programmable thermostats. The program also incented common area lighting, envelope upgrades, and refrigeration upgrades. The program had eight<sup>1</sup> unique PHA participants, who completed 105 projects across their campuses and buildings.<sup>2</sup> Participants could complete in-unit upgrades, common area upgrades, or both. In CY2018 the program distributed 11,907 measures as shown in the following table and graph.

| Table 2 | 2-1. CY2018 Volum | netric Findings Detail |  |
|---------|-------------------|------------------------|--|
| In      | Unit Unarados     | Common Aroa Unarados   |  |

| Participation        | In-Unit Upgrades | Common Area Upgrades | Total  |
|----------------------|------------------|----------------------|--------|
| Participants (PHAs)* | 7                | 7                    | 8*     |
| Installed Projects   | 20               | 85                   | 105    |
| Measure Count+       | 5,276            | 6,631                | 11,907 |

\*The total number of participants does not equal the sum of in-unit and common area upgrade participants because one participant could complete in-unit upgrades, common area upgrades, or both.

†Total measure count excludes measures quantified in feet or MBH.

<sup>&</sup>lt;sup>1</sup> There 21 PHAs in the ComEd service territory.

<sup>&</sup>lt;sup>2</sup> One PHA may own multiple campuses or buildings and complete several independent projects.

Figure 2-1. Number of Measures Installed by Type

### **3. PROGRAM SAVINGS DETAIL**

Table 3-1 summarizes the incremental energy and demand savings the PHES Program achieved in CY2018. The gas savings are only those that the gas utilities are not claiming and ComEd can claim.<sup>3</sup> The program achieved CY2018 verified net savings of 2,472,099 kWh. Total electric plus gas (therms converted to kWh) program savings for CY2018 is 2,540,045 kWh.

<sup>&</sup>lt;sup>3</sup> The evaluation will determine which gas savings will be counted toward goal while producing the portfolio-wide Summary Report.

# 4. CUMULATIVE PERSISTING ANNUAL SAVINGS

The measure-specific and total verified gross savings for the PHES Program and the cumulative persisting annual savings (CPAS) for the measures installed in CY2018 are shown in the following tables and figure. The program achieved CY2018 verified net savings of 2,472,099 kWh. The program achieved 67,946 kWh CPAS equivalent of gas savings converted to electricity that might be counted toward ComEd's goal<sup>4</sup> (shown in the gas CPAS table). Adding the savings converted from gas savings to the electric savings produces CY2018 savings of 2,540,045 kWh.

<sup>&</sup>lt;sup>4</sup> The evaluation will determine which gas savings will be counted toward goal while producing the portfolio-wide Summary Report.

Note: The green highlighted cell shows program total first year gas savings in kWh equivalents.

\* A deemed value. Source: ComEd\_NTG\_History\_and\_PY10\_Recommendations\_2017-03-01.xlsx, which is to be found on the IL SAG web site here: http://ilsag.info/net-to-gross-framework.html.

† Lifetime savings are the sum of CPAS savings through the EUL.

‡ kWh equivalent savings are calculated by multiplying therm savings by 29.31.

‡§ Expiring savings (therm) are equal to CPAS Yn-1 - CPAS Yn + Expiring Savings Yn-1.

# 6. IMPACT ANALYSIS FINDINGS AND RECOMMENDATIONS

### 6.1 Impact Parameter Estimates

The EM&V team calculated verified savings for the PHES Program by applying savings algorithms from the Illinois Technical Reference Manual (TRM) v6.0. The team leveraged program tracking data such as LED wattage, LED lamp type, installed measure location (e.g., for faucet aerators), boiler capacity and efficiencies (for tune-up measures), and insulation R-values to inform savings assumptions. For variables not informed by the tracking data the evaluation team relied on defaults from the IL TRM V6.0.

The lifetime energy and demand savings are estimated by multiplying the verified savings by the effective useful life for each measure.

#### Table 6-1. Savings Parameters

## 6.2 Other Impact Findings and Recommendations

The evaluation team has developed several recommendations based on findings from the CY2018 evaluation, as follows:

**Finding 1.** The evaluation team was unable to calculate a realization rate for gross demand savings since ComEd does not track gross demand values.

Recommendation 1. The evaluation team recommends ComEd track gross demand reduction.

**Finding 2.** The evaluation team found variability in realization rates at the measure level. **Recommendation 2**. Provide all variable inputs for measures that incorporate custom calculations (i.e., gas furnace, boiler tune-up, refrigerator, room air conditioner, air sealing, attic insulation), to allow for more transparent comparison between ex ante and verified savings.

- **Recommendation 3.** Incorporate actual equipment specifications in ex ante calculations for variables where the IL TRM allows actual values to be used (e.g., wattages, capacities, etc.).
- **Recommendation 4**: Apply an in-service rate of 98% to all common area lighting measures as specified in the IL TRM.

### 7. APPENDIX 1. IMPACT ANALYSIS METHODOLOGY

The evaluation team calculated gross verified savings for the PHES Program by applying savings algorithms from the IL TRM v6.0. The team prioritized project specific information to inform savings calculations where the IL TRM advises to use actual values. For variables where project information did not provide this information, the evaluation team relied on defaults from the IL TRM v6.0.

The evaluation team calculated verified net energy and demand savings by multiplying the verified gross savings estimates by a deemed NTG of 1.0. In CY2018, the NTG estimates used to calculate the verified net savings were approved through a consensus process managed through the Illinois Energy Efficiency Stakeholder Advisory Group (IL SAG).

### 8. APPENDIX 2. IMPACT ANALYSIS DETAIL

The differences between the ex ante and verified per unit gross savings estimates by measure are discussed below. However, since the evaluation team did not receive ex ante savings calculations and variable assumptions for all custom calculated CY2018 measures, we are unable to identify all the differences between ex ante and verified per unit savings for those measures. We note where this occurs below.

LEDs (Common Area)

- LED Wattage: To calculate verified savings, the evaluation team applied the average actual
  installed LED wattage specified in the project documentation provided by the implementer, where
  available. The project documentation provided specification sheets for the exact installed LED
  model. The IL TRM states to use the actual wattage when known, otherwise use the default
  wattages presented within the TRM.
- In-service Rate: The evaluation team applied an in-service rate of 98% to verified savings, as specified in the IL TRM v6.0. The implementation team did not apply the in-service rate adjustment to ex ante calculations.

#### LEDs (Exit Signs)

LED Wattage: To calculate verified savings for LED exit signs, the evaluation team applied the
actual installed LED exit sign wattage (3.5W) specified in the provided project documentation.
The project documentation included specification sheets for the exact installed LED exit sign
model. The IL TRM v6.0 states to use the actual wattage when known, otherwise use the default

exit sign wattage of 2W. The implementation team used the default wattage of 2W in ex ante calculations.

#### LEDs (Exterior)

- In-service Rate: The evaluation team applied an in-service rate of 98% to verified savings, as specified in the IL TRM v6.0. The implementation team did not apply the in-service rate adjustment to ex ante calculations.
- Wattages: The evaluation team used baseline and efficient wattages from the program tracking database for the Exterior/Garage LED measures, whereas the Implementation Team used default values from the IL TRM v6.0.

#### Advanced Power Strips

• Delivery Type: During the Wave 1 review, the evaluation team pointed out that ex ante savings inconsistently applied the deemed values from the IL TRM v6.0 for different delivery mechanisms for energy and demand. The implementation team corrected this issue for energy savings, but the issue still exists for demand savings, which continue to use "all other delivery mechanisms" rather than "energy efficiency kit". The evaluation team received confirmation from the implementer that all advanced power strips are leave-behind and therefore should apply the deemed "energy efficiency kit" TRM values consistently for both energy and demand savings.

#### All Custom Measures

- For custom measures, including gas furnace, boiler tune-up, refrigerator, room AC, air sealing, and attic insulation, the evaluation team used the algorithms and default assumptions where applicable from the IL TRM v6.0. We also leveraged values from the program tracking database as much as possible such as R-values and areas of insulation for attic insulation measures and capacities and efficiencies for boiler tune-up measures. However, the spreadsheet documenting ex ante assumptions provided by the implementation team does not include all variable inputs for these measures. Therefore, we are unable to pinpoint specific reasons for differences in realization rates for these custom calculated measures.
- Negative space heating savings resulted from boiler tune-up measures where reported efficiency values were lower after the tune-up occurred.

# 9. APPENDIX 3. TOTAL RESOURCE COST DETAIL

Table 9-1, below, shows the Total Resource Cost (TRC) table. It includes only the cost-effectiveness analysis inputs available at the time of finalizing this impact evaluation report. Additional required cost data (e.g., measure costs, program level incentive and non-incentive costs) are not included in this table and will be provided to evaluation later.
